

User Type	User Demographics	User Habits	Problems & Needs
Cabin and cottage owners	Usually between 35 and 70. A mix of working professionals and retirees, many with kids or grandkids. Most live in the city and drive out to the cabin on weekends and through the summer.	They check the weather app before heading out and keep up with the lake association or RM Facebook page. At the cabin they're on their phone, not a laptop.	They'd like to know how a fire near the cabin would behave today, and get a heads-up when the danger climbs. Fuel codes and index numbers mean nothing to most of them, so it has to be in plain words.
Farmers and ranchers	Roughly 30 to 70, working farmland or pasture in rural Saskatchewan, Alberta or Manitoba. Very practical people. Most have no formal fire training.	Up early and outside most of the day. They check wind and the forecast on their phone between jobs, burn stubble or brush in spring and fall, and hear a lot of their news on local radio or from neighbours.	Is it safe to burn today? If a grass fire started, how fast would it run with this wind? They need that answer from the field in under a minute, without typing in a pile of numbers.
Small towns, RMs and volunteer fire departments	Municipal staff, councillors and volunteer firefighters, usually 25 to 65. Budgets are small and nobody on staff is a fire behaviour specialist.	Everyone wears several hats. Fire information reaches them through provincial bulletins, emails and the CWFIS website, and they pass updates on to residents through Facebook and the town site.	A quick way to see the danger around their area and explain it to residents without learning expert software. It would help to watch a few spots at once, like the townsite and the campground.
Campers and hikers	Mostly 18 to 45. Students, young working adults and some families. Very	Trips get planned on the phone with Google Maps, AllTrails and the park	Can we have a campfire tonight? Is there a fire nearby that could reach us? Cell

	comfortable with apps and maps.	website. They head out on long weekends and most of the summer, and a lot of their news comes from social media.	signal is often weak where they go, so the danger level has to load fast.
Travellers heading to fire-prone areas	Adults of most ages, often families. Tourists driving through places like the Rockies (Calgary to Banff) in summer, sometimes from out of province.	They book weeks ahead, compare options online, and look at the weather a few days before leaving. Most don't know the area well.	They want to check fire danger for each stop, both close to the trip and weeks before it. Some also care whether a place has burned before, or what the smoke will be like.
