

Business model (value)	What is offered?	To Whom it is Offered To	How it is Offered	Why you Capture Value
Free public app (public safety first)	The whole core app, free: the map, how a fire would spread at any spot, the danger level in plain words, fire history and the air quality layer.	Anyone in Canada, mainly cabin owners, farmers, campers and travellers.	A web app that works on phones and computers. People find it through search, social media, and links from towns and parks.	We don't think safety info should sit behind a paywall. A big base of people who trust the app is also what the paid models below depend on.
Community subscription for towns and RMs	A dashboard for watching several places at once, area-wide alerts, and posts written so residents can understand them.	Small towns, rural municipalities, First Nations communities and volunteer fire departments.	Yearly subscription. We'd sell it directly and through provincial municipal associations, and set each community up over a video call.	It saves staff time and lets them warn residents sooner. That costs far less than hiring a specialist, and yearly fees give us steady income.
Optional premium features	Convenience extras on top of the free app, such as text message alerts and room for more saved places. The safety info itself stays free.	Heavy users, for example people with more than one property or outfitters who plan lots of trips.	A small monthly or yearly payment inside the app.	Text messages cost us money to send. Letting the few people who want them pay for them helps keep the free version running.
Partnerships and embeds with tourism and parks	A small version of our map that sits on someone else's	Campgrounds, tourism boards and park operators.	They pay a licence to embed the map, which shows our	Their guests get fire safety info they can trust, and they don't have to build it. We get income plus new users

	website or booking page.		name and links back to the app.	coming in from their sites.
Grants and research funding	A working public tool built on Canadian government data and fire science, along with what we learn from how people use it.	Government wildfire and emergency preparedness programs, research funds and public safety organizations.	Grant applications, or a pilot project with one province or a small group of communities.	Governments already fund wildfire preparedness work. A free tool that helps communities get ready is the kind of thing that funding goes to, though we'd still need to find the specific programs.
